

## About Us

AGROSTREAM is an Aragonese startup provider of technological solutions for AGRICULTURE. They are experts in the development of methodologies for crop monitoring, in geographic information systems and in the analysis and interpretation of agronomic parameters through data in the cloud captured with their sensors, using GIS, IoT and Big Data technologies for the Agroindustry.

Their knowledge and experience allow them to implement solutions tailored to each client, designing specific sensors for the requirements of each project, taking into account the characteristics and parameters necessary to monitor, avoiding the generation of superfluous data that load the digital cloud with unnecessary information and slow down the system.

They collect, store and process all this data in an intelligent way to provide value-added information for farmers and entrepreneurs in the agribusiness industry.

At Agrostream they have a team made up of agronomists, industrial and agricultural engineers, with decades of experience in the agricultural, information technology, geographic information systems, energy, irrigation systems and hydraulic works sectors.

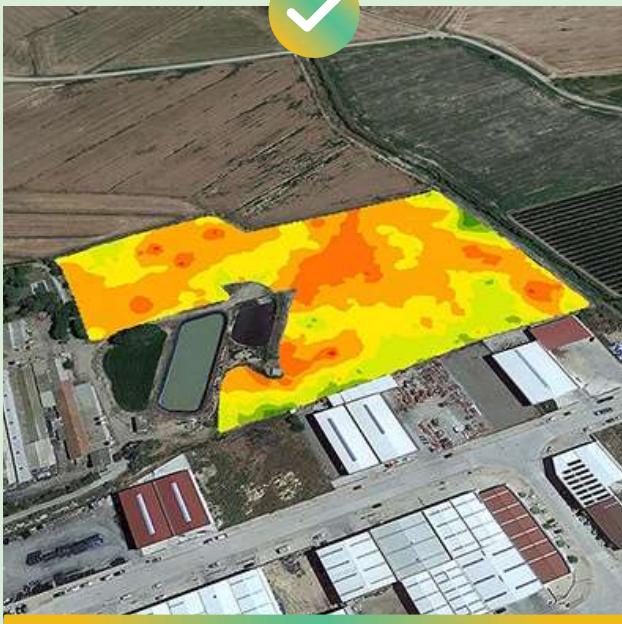

# Services

**Soil texture maps**
